

Alexandre Plana

Front-end developer — Vue 3 · TypeScript

Industrial applications · Micro-frontends

👤 About

I develop industrial applications, drawing on a strong front-end and UI/UX background. At Schneider Electric, I built several Vue 3 micro-frontends of the IECA IIoT platform, along with components shared across teams. On Xistar, I work from the operator interface through to the services that ingest and distribute operational data. My approach connects user needs, architecture and technical constraints, with close attention to product consistency from the initial design to delivered code.

📌 Web development – X-PERT

Datacorp `Mar 2026 - present`
R&D Consultant – client X-PERT

📁 x-pert/xistar

Full-stack developer

Xistar – maritime tactical command center · 2026

👥 Team of 3 developers working with AI agents, multidisciplinary roles

A browser-based command center: tactical situation, mission and drone control, alerts, multi-screen operation and history navigation. I work from functional design to delivery, mostly on the front end.

KEY CONTRIBUTIONS

- Functional design, mockups, visual design and architecture decision records (ADRs) from operational requirements.
- Operator interface in `#typescript` and `#react`: `#dockview` workspace, `#maplibre` and `#deckgl` mapping with NATO APP-6 symbology.
- Multi-screen application driven from a master station: screen sets, remote view dispatch and real-time control of each display; history navigation.
- `#go` services, to a lesser extent: AIS, NMEA, CoT and MAVLink ingestion, publication over `#mqtt` and REST, alerts with escalation.
- End-to-end tests, `#docker` images and `#gitlab-ci` pipelines through to delivery.

Companion tools: a mobile app for alerts and commands (`#react`, `#socketio`), a video-wall emulator, and a drone and fleet simulator (`#nodejs`, `#mqtt`).

`typescript` `react` `go` `dockview` `maplibre` `deck.gl` `mqtt` `docker` `gitlab ci`

📁 x-pert/ai-workflow

AI agent design & orchestration

AI-agent development workflow · 2026

An AI-assisted development workflow inspired by the BMAD method and used on Xistar and other projects. Several AI providers are combined (Claude, Codex and Jev): one produces, another reviews.

KEY CONTRIBUTIONS

- Domain-specific agents and an orchestrator that dispatches work to them.
- Non-regression agents built on user journeys and a strictly defined design system.
- A dedicated `#docker` image per project, with agents, workflow and dependencies installed before each run; runs dispatched by `#gitlab-ci` to a dedicated machine.
- A `#vue3` and `#typescript` tracking tool fed by agent hooks.
- Session reports analyzed to correct agent instructions and the workflow.

`claude` `codex` `jev` `bmad` `docker` `gitlab ci` `vue3` `typescript`

📁 x-pert/xpert-design-system

UI design & front-end architecture

X-PERT design system · 2026

A design system shared by X-PERT's technical applications, website, documents and videos.

KEY CONTRIBUTIONS

- Designed components and interfaces in `#figma`.
- Built a `#react` and `#typescript` library on `#shadcn`: common components and technical visualizations (charts, treemaps, timelines, mapping, resizable panels).
- Distributed it through a private `#npm` registry, with integration documentation.
- A set of skills, rules and linters dedicated to overall interface consistency.

`figma` `react` `typescript` `shadcn` `npm`

📌 Vue.js · micro-frontend — Schneider Electric

Datacorp 2023 – 2026
R&D Consultant — client Schneider Electric

📁 schneider-electric/iiot-edge-ieca

Front-end developer

Industrial Automation Edge (IECA) · 2023 – 2026

👥 4 Scrum teams of about ten people; around 80 people in total including management, validation, test automation, cybersecurity and solution architects

IECA is Schneider Electric's IIoT Edge platform: some fifteen Vue 3 micro-frontends loaded by single-spa, backed by Go services. I helped set them up and evolve them, especially those listed below, and built the shared template.

KEY CONTRIBUTIONS

- Set up and evolved the micro-frontends in `#vue3`, `#typescript` and `#pinia` (connectivity, computations, conditions, alerts, scripting, data and administration) and built the shared template.
- Beyond my own team, still on the front end: shared components in the common library (configurable table, property selector, routing foundation) and code reviews, including pull requests from other teams.
- Quality focus: `#vitest` and `#jest` unit tests for components, stores and utilities, `#sonarqube` analysis; a clean codebase and a focus on quality and maintainability.
- Occasional back-end extensions needed by front-end changes.

`vue3` `typescript` `single-spa` `pinia` `vitest` `jest` `sonarqube` `docker` `figma` `jira`

IECA micro-frontends

All in `#vue3` and `#typescript`, loaded as `#single-spa` applications, with `#pinia`, Vue Router and Schneider Electric's Quartz design system. The newer applications share one architecture: container/presentational components, typed API-to-model mappers, one store per domain. Common types and services (authentication, global routing, data transformation, modal handling…) are shared from a utility micro-frontend, ieca-web-utils.

SHARED FOUNDATION	
🧩 `@ieca/ieca-web-utils` **Shared library**	Configurable table, property selector, step wizard, breadcrumb header, dialogs; common stores, HTTP client, typings and test utilities.
🧩 `ieca-vue3-ui-template` **Micro-frontend template**	Starting point for new applications: rights-aware router, common stores, single-spa setup and tests.
DATA & CONNECTIVITY	
🧩 `ieca-connectivity-ui` **OT/IT connectivity**	The largest application: OPC UA and Modbus connectors configured through generated forms, a variable-editing grid, CSV import, IT interfaces and groups.
🧩 `ieca-data-management-ui` **Data management**	Filterable data-model tree, properties and their assignments, import, exportable history and value writes.
🧩 `ieca-datamodel-ui` **Data model**	Tree editor for the model: levels, property mapping and import; a rewrite of the former application for the new API.
PROCESSING & MONITORING	
🧩 `ieca-computation-ui` **Computations**	Computed variables created step by step: properties, server-validated formula with a function catalog, sliding or tumbling time window.
🧩 `ieca-condition-ui` **Conditions**	If/Then rules step by step: properties and quality level, validated formula, then an action (application, command or script).
🧩 `ieca-scripting-ui` **Scripting**	Scripts edited in Monaco with suggestions, run or cancelled; executions and parsed logs; rights-aware navigation.
🧩 `ieca-alert-manager-ui` **Alerts**	Alert list and history, acknowledgement and closing, bulk deletion and CSV export.

PLATFORM ADMINISTRATION	
🧩 `ieca-platform-configuration-ui` **Configuration**	Server certificate, disk usage, configuration export and import, application settings through generated forms.
🧩 `ieca-mail-ui` **SMTP mail**	SMTP server configuration with certificate checks and a test message.
🧩 `ieca-overview-ui` **Overview**	Installed Edge applications with their provider and license.
PROTOTYPES	
🧩 `schneider-electric/ieca-ip-sprint` **IP Sprint · data on mobile · 2024**	IECA data management on mobile, with Capacitor then Quasar for Android and iOS.
🧩 `schneider-electric/ieca-ip-sprint` **IP Sprint · on-call notifications**	IECA alerts relayed to a dedicated mobile app as push notifications for on-call operators.

📌 Industrial AR application — Schneider Electric

Datacorp `2017 – 2023`
R&D Consultant — client Schneider Electric

📁 `schneider-electric/aoa-ar-app` — Front-end developer

Augmented Operator Advisor (AOA) — Industrial AR Application · 2017 – 2023

👥 3 Scrum teams (7, 5 and 4 people); grew from front-end developer to main developer, until the project ended

Augmented-reality solution for industrial operators, made of three modules: a web application, a cross-platform mobile app (Android, iOS, Windows) in C# with Unity, and a runtime. I was responsible for design, mockups, front-end architecture, development, releases and client-specific development.

KEY CONTRIBUTIONS

- Designed the interface, mockups and front-end architecture for three platforms, in portrait and landscape.
- Developed offline operation and `#http` synchronization, and contributed to the `#python` project server.
- Kept projects backward compatible by reading legacy formats and migrating them on load.
- Built an externalized style system and client-specific features for `#oem` customers.
- Shipped releases to each store (Android, iOS, Windows).
- Built a `#unity` asset that runs functional tests after the build on a real `#ios`, `#android` or `#windows` tablet.
- Maintained the product at end of life: cybersecurity updates, client change requests (PCRs) and new releases.

`unity` `c#` `ar` `android` `ios` `windows` `python` `figma` `jira`

📌 Serious games & simulation — Oreka Ingénierie

Oreka Ingénierie `2013 – 2017`
C# / Unity 3D Developer

📁 `oreka/xr-projects` — Design & front-end development

Serious games and simulators — EDF, RTE, AREVA, DCNS, SUEZ · 2013 – 2017

👥 Teams of 1 to 3 people

Serious games, simulators and visualization tools for industry, nuclear and defense. My work focused on the design and front-end development of the applications.

KEY CONTRIBUTIONS

- Analyzed requirements and operating procedures and turned them into workflows, scenarios and mockups.
- Built 2D/3D interfaces and interactions in `#csharp` with `#unity`, including `#vr` and `#ar` devices.
- Integrated and optimized CAD models (`#solidworks`, `#3dsmax`) and CPU/GPU performance, through to delivery and client demos.

`unity` `c#` `wpf` `vr` `uiux`

PROJECTS

🗂️ `oreka/dosicase` **Dosicase · 2015 – 2017**	Radiation-safety training simulator for practice sites: learning path, interface and interactions.
🗂️ `suez/radioprotection` **Radiation-safety training · 2014 – 2015**	Simulated accident scenarios and rescue-team management.
🗂️ `simulhom` **MSD prevention · 2015 – 2017**	3D ergonomics simulator designed with ergonomists: workflows, interface and postural-risk indicators.
🗂️ `chu-caen/emsim-basic` **Interventional surgery · 2013 – 2015**	Medical simulation: dosimetry and exposed areas shown throughout the scenarios.
🗂️ `areva/emem` **EMEM · 2014 – 2016**	3D simulation of a mobile enclosure for evacuating nuclear equipment, with WPF operator interfaces.
🗂️ `edf/aeroball` **Aeroball · 2014 – 2015**	Serious game for training on the Aeroball control station.
🗂️ `suez/maintenance-generateurs-de-vapeurs` **Steam generators · 2014 – 2015**	Serious game preparing maintenance work during plant outages.

🛠️ Personal projects

🛠️ REACT TIMELINE LIBRARY

time-weave

A `#typescript` and `#react` library for interactive timelines synchronized with the host app: hierarchical rows, playback, navigation keys and live mode, on a time engine independent of React.

`react` `typescript` `vitest` `playwright`

🛠️ MULTI-SCREEN BROADCASTING LIBRARY

multi-screen

A `#typescript` library that describes a screen as JSON data made of `#dockview` panels, routes it at runtime and pushes it to any device, driven remotely from a control room: patch updates, theme, rotation, acknowledgements.

`typescript` `dockview` `react` `nodejs` `vitest`

🛠️ AI-ASSISTED DEVELOPMENT WORKFLOW

iasit

Iasit is a coordination tool for software development assisted by AI agents.

`react` `typescript` `nodejs` `zod` `sigma.js` `api rest` `mcp`
